Subject Professor

I. Objectives

- To connect two Windows laptops or PCs wirelessly using the same Wi-Fi network.
- To use Nearby Sharing for automatic device detection and file transfer.
- To share and receive files without manually configuring static IPv4 addresses.
- To transfer files from one computer to another using a wireless connection.
- To verify if the shared file was successfully received by the destination device.

II. Materials Needed

- 2 Windows-based PCs or laptops
- Stable Wi-Fi connection
- Files or folders to be shared
- Nearby Sharing feature

III. Procedures

1. Connect Both Devices to the Same Wi-Fi Network

- Turn on the Wi-Fi connection on both laptops.
- Connect PC 1 and PC 2 to the same wireless network.
- Wait until the Wi-Fi icon shows that both devices are properly connected.
- Make sure the connection is stable before proceeding to the next step.

2. Enable Nearby Sharing on Both PCs

- On both laptops, open Settings.
- Go to System.
- Select Nearby Sharing.
- Turn ON Nearby Sharing.

- Set the sharing option to Everyone Nearby.
- This allows both devices to detect each other during file sharing.

3. Set the Network Profile to Private

- On both computers, open Settings.
- Go to Network & Internet.
- Select Wi-Fi.
- Click the connected Wi-Fi network.
- Set the Network Profile to Private.
- This setting helps the devices communicate in a trusted network environment.

4. Prepare the File to Be Shared

- On PC 1, open File Explorer.
- Locate the file or folder that needs to be shared.
- Right-click the selected file or folder.
- Choose Share from the options.
- Wait for the sharing panel to appear.

5. Select the Receiving Device

- In the sharing panel, look for the name or icon of PC 2.
- Click PC 2 as the target receiving device.
- Wait for the transfer request to be sent.
- Make sure PC 2 is nearby and has Nearby Sharing enabled.

6. Accept the File Transfer on PC 2

- On PC 2, wait for the file transfer notification.
- Click Save to accept the file directly.
- Click Save As if you want to choose a specific folder location.
- Wait until the file transfer is completed.

7. Check the Received File

- After the transfer finishes, open the folder where the file was saved.
- Locate the received file on PC 2.
- Open or check the file to confirm that it was transferred successfully.
- Repeat the process if more files need to be shared.

IV. Conclusion

This activity showed that two laptops can share files easily through a Wi-Fi connection using the Nearby Sharing feature. By connecting both devices to the same wireless network, enabling Nearby Sharing, and setting the network profile to private, the computers were able to detect each other and transfer files without manually assigning IP addresses. The successful file transfer proves that wireless sharing is a simple, convenient, and efficient method for exchanging files between devices using built-in Windows features.
